DIRECTIONS FOR APPLYING

With every ceiling we furnish a blue print or working drawing showing the exact size and arrangement of each member of the combination ceiling design; also a packing slip containing an itemized list of the material shipped. This should be checked with the material immediately and if any shortage exists we will, upon being notified, make correction, providing such notice is given us before you start to erect the ceiling.

Study the plan carefully, verify the measurements and as this plan is made strictly in accordance with the measurements and information furnished us, and ample allowance is made for cutting, laps and waste, any additional materials required on account of incorrect information or measurements, or changes in measurements, will be charged for extra.

Furring strips must be used when applying Metal Ceiling or Sidewall direct to joists or over plaster. When applying over sheathing furring strips are not necessary.

When applying the furring strips from both ends of the room, strike a chalk line to be used as your "Starting Line" from which to work. When furring for continuous plates the first strip is placed on the "Starting Line" and at right angles with the joists, placing the additional strips parallel and 12 inches apart, or in case of the plaster being loose, it is best to strip every 6 inches, then the cross-furring or headers at the laps of the plates, which would be every 48 inches or 96 inches, as the case may be. It is essential that the furring strips be applied exactly to the center of the nailing points on every plate, as indicated on the plan.

It is not always necessary to have special furring for the cornice, but the wall line should be straight and furring applied to the ceiling and wall to which the brackets for the cornice are nailed. Brackets to fit the cornice are furnished, 1 for every 4-foot section and 2 for each miter.

Work should be commenced in the rear and brought forward, when possible.

Stripping should be leveled and with this done the field plates should be applied first, referring to the plan for the starting point. The plate to be applied first is marked "Starter" and the plan shows the distance it is from the line of the cornice. The border or moulding should be next applied, taking care to leave the outer edge of the mould un-nailed. The filler is next applied, lapping one edge under the moulding, which outer edge is then nailed. The cornice is then put up, lapping over the outer edge of the filler, thus completing the ceiling.

We furnish square inside and outside miters for nearly all our cornices. For those for which we make no miters we send sufficient material for the erector to make plain miters.

Our ceilings are primed one coat of light gray paint on both sides.

We include wood brackets for cornice and cone head nails for erection.

Wood furring strips are never provided unless ordered special and then they are charged for extra.

Practically the same instructions apply for furring Sidewalls. In cases where wainscot is used, the wainscot is applied first and then the wall plate, working from the bottom up to the edge of the cornice.
